

Swiggy (Food Delivery) — Teardown

Competitive intelligence briefing, as if inside Zomato/Eternal, Blinkit, or Zepto · research-based, no hands-on trial

1. Product Overview

Swiggy's Food Delivery segment, positioned under the current tagline "*Swiggy Karo, Phir Jo Chahe Karo*" — broad convenience framing, a shift from earlier food-specific taglines like "No Order Too Small." Independent read: originally "the food delivery app," distinct from Zomato's restaurant-discovery roots; that distinction has largely eroded as both became full-stack convenience platforms. Went public Nov 2024 (~\$11.3B valuation), giving this teardown unusually rich public segment data.

2. Target Users

- **Primary:** urban, time-constrained consumers — JTBD is "get food without friction," not "discover new restaurants."
- **Secondary:** occasion/small-order users — the historical no-minimum-order policy specifically serves this segment.
- **Emerging (via Bolt):** instant-gratification QSR loyalists — JTBD shifts to "10-minute coffee/burger, as fast as walking to the outlet."

[ASSUMPTION: inferred from positioning/marketing, not primary user research]

3. User Journey

Location-first onboarding → browse/search → cart → checkout → live tracking → rate/reorder — largely undifferentiated from Zomato's at this level. The real differentiation sits inside the loop: three speed tiers now run on one app (standard, **Bolt** — 10-min, 2km radius, minimal-prep menu — and a separate **Snacc** app for the same instant-snacking JTBD). Swiggy One membership (cross-line: food, Instamart, Dineout, Genie) is the primary retention structure, converting single-category users into multi-category ones.

4. What Works Well

- Restaurant-partner density (~200,000 partners, 600+ cities) — a genuine, slow-to-replicate moat.
- Bolt has real disclosed traction: ~10% of total food-delivery orders as of Nov 2025, per Swiggy's Food Marketplace CEO — not a paper launch.
- Fastest food-delivery GOV growth in ~4 years: +22.6% YoY in Q4 FY26, vs. Zomato/Eternal's +18.8% NOV growth — the growth-rate gap is closing even though the market-share gap (~42% vs. ~57%) hasn't moved.

5. Pain Points

- Consolidated company profitability remains negative; market commentary attributes this mainly to Instamart, but Swiggy hasn't publicly disclosed a clean food-delivery-only P&L to make that case directly — a real communications gap.
- Recurring fee-stacking backlash (commission + packaging fee + platform fee) resurfaced publicly as recently as Jan 2026; both Swiggy and Zomato also face an active CCI antitrust investigation reportedly finding preferential treatment toward some restaurant partners.
- UBS attributed Nov 2025 share gains partly to declining average order value — a real question about whether recent growth is volume via trading down, not pure category strength.
- No integrated dining-discovery layer inside the core Food app (Dineout is a separate app) — thin if user intent ever shifts back toward discovery over fast fulfillment.

6. Metrics I'd Measure

(general product health, not feature-specific — see Section 10 for that) - Food-delivery GOV growth rate and market-share trend, tracked quarterly against Zomato/Eternal - Average order value trend (the specific weak signal flagged in Section 5) - Restaurant-partner churn/retention rate - Delivery SLA adherence (on-time rate) across the three speed tiers

7. Feature Prioritization (RICE)

Ranking Swiggy's built capabilities by how urgently a rival should respond — Reach/Impact/Effort on relative 1–5 scales, Confidence on standard 0.5/0.8/1.0 bands.

[These are judgment estimates from public evidence, not internal telemetry.]

Capability	Reach	Impact	Confidence	Effort-to-Counter	RICE
Bolt (10-min delivery)	4	5	0.8	3	5.33
Swiggy One (cross-category membership)	5	4	0.5	4	2.50
Restaurant network breadth	5	3	0.8	5	2.40
Incognito ordering mode	2	1	0.8	1	1.60
Snacc (separate instant-snacking app)	2	2	0.5	2	1.00

Bolt ranks highest by a wide margin — it's already reshaping category expectations (Section 4) and is the one capability Zomato has felt compelled to directly counter (its "Quick" pilot, Jan 2025). Restaurant breadth ranks low on RICE specifically because effort-to-counter is near-maximal — not because it's unimportant, but because it isn't a feature response, it's a years-long structural investment.

8. One Feature I'd Build

[Framed as: what a challenger should attack — best judgment, consistent with the competitive-intel purpose locked at the start of this teardown]

An integrated Restaurant Discovery Feed inside the core ordering flow — not a separate app like Dineout.

Recommendation, not a hedge: **don't** compete on Bolt's territory feature-for-feature (Zomato's Quick, Blinkit's Bistro, and Zepto Cafe are already racing there, and matching speed in a transparent market just compresses everyone's margins further, per Section 5's growth-quality concern). Instead, attack the evidenced gap: Swiggy has no in-app discovery-first surface, because Dineout sits outside the Food app entirely.

Why this over other candidates: it targets a real, sourced weakness (Section 5) rather than manufacturing one, and it avoids reinforcing the exact speed-race dynamic where Swiggy currently has real, disclosed momentum (Section 4/7).

9. Wireframes (Structured Mockup — Single Screen)

The Discovery Feed screen, embedded in the core Food tab (not a separate app):

New: "Discover" tab added alongside Food/Bolt/Instamart/Dineout — same app, not a separate download. **Chips** filter the feed by trend/price/rating, not just cuisine — surfaces restaurants a user hasn't ordered from before. **Social proof line** is the core discovery mechanic — replaces "you've ordered here 12 times" with "why order somewhere new." **ADD button** is one-tap add-to-cart from the feed itself — discovery shouldn't cost an extra screen of friction.

10. Success Metrics

(tied specifically to the Discovery Feed feature in Section 8 — not a repeat of Section 6) - % of orders attributable to Discovery Feed engagement (attribution, not blended with overall GOV) - Order-frequency lift among Feed-engaged users vs. non-engaged users - Feed card click-through rate - New-restaurant trial rate (orders from restaurants a user hasn't ordered from before) — the direct test of whether this closes the discovery gap, not just adds another feed

No baseline or target numbers exist for a feature that doesn't exist yet — these are the metrics to instrument at launch, not confirmed targets.
